

Web API Design with Spring Boot Week 13 Coding Assignment

Points possible: 75

URL to GitHub Repository: <https://github.com/sraznoff/JeepSalesAPI.git>

URL to Public Link of your Video: <https://youtu.be/0t07ONcvYMc>

Instructions :

1. Follow the **Coding Steps** below to complete this assignment.

- In Spring Tool Suite (STS), or an IDE of your choice, write the code that accomplishes the objectives listed below. Ensure that the code compiles and runs as directed.
- Create a new repository on GitHub for this week's assignment and push your completed code to this dedicated repo, including your entire Maven Project Directory (e.g., jeep-sales) and any additional files (e.g. .sql files) that you create. In addition, screenshot your ERD and push the screenshot to your GitHub repo.
- Include the screenshots into this Assignment Document indicated by: 
- Create a video showcasing your work:
 - In this video: record and present your project verbally while showing the results of the working project.
 - Easy way to Create a video: Start a meeting in Zoom, share your screen, open Eclipse with the code and your Console window, start recording & record yourself describing and running the program showing the results.
 - Your video should be a maximum of 5 minutes.
 - Upload your video with a public link.
 - Easy way to Create a Public Video Link: Upload your video recording to YouTube with a public link.

2. In addition, please include the following in your Coding Assignment Document:

- The requested screenshots, indicated by: 
- The URL for this week's GitHub repository.
- The URL of the public link of your video.

3. Save the Coding Assignment Document as a .pdf and do the following:

- Push the .pdf to the GitHub repo for this week.
 - Upload the .pdf to the LMS in your Coding Assignment Submission.
-

Web API Design with Spring Boot Week 13 Coding Assignment

Here's a friendly tip: as you watch the videos, code along with the videos. This will help you with the homework. When a screenshot is required, look for the icon:  You will keep adding to this project throughout this part of the course. When it comes time for the final project, use this project as a starter.

Here's a hint: make sure you are running a version of Java that is 11+. To get the version, open a Windows Command Prompt window or a Mac Terminal window and type `java -version`. If you need to upgrade, go here: <https://docs.aws.amazon.com/corretto/latest/corretto-11-ug/downloads-list.html>. Pick the .msi installer version (Windows) or the .pkg version (Mac).

Project Resources: <https://github.com/promineotech/Spring-Boot-Course-Student-Resources>

Web API Design with Spring Boot Week 13 Coding Assignment

Coding Steps:

- 1) Create a Maven project named `JeepSales` as described in the video.
 - a) In Spring Tool Suite, click the "File" menu. Select "New/Project...". In the popup, expand "Maven" and select "Maven Project". Click "Next".
 - b) Check "Create a simple project (skip archetype selection)". Click "Next".
 - c) Enter the following:

Group Id	<code>com.promineotech</code>
Artifact Id	<code>jeep-sales</code>

- d)
Click "Finish".

- 2) Navigate to the Spring Initializr (<https://start.spring.io/>).

- a) Confirm the following settings:

Project	Maven Project
Language	Java
Spring Boot	Select the latest stable version (not SNAPSHOT or RC)
Group	<code>com.promineotech</code>
Artifact	<code>jeep-sales</code>
Name	<code>jeep-sales</code>
Description	Jeep Sales
Package name	<code>com.promineotech</code>
Packaging	Jar
Java	11 (or whatever your version is)

- b) Add the dependencies from the Initializr:
 - i) Web
 - ii) Devtools
 - iii) Lombok
- c) Click "Explore" at the bottom of the page.

Web API Design with Spring Boot Week 13 Coding Assignment

- d) Click "Copy" to copy the pom.xml generated by the Initializr to the clipboard.
- 3) In **Spring Tool Suite**, open pom.xml (in the project root directory). Select all the text in the editor and replace it with the XML copied to the clipboard in the prior step.
 - a) Navigate to <https://mvnrepository.com/>. Search for springdoc-openapi-ui. Select the latest version and add the entry to the POM file in the <dependencies> section.
- 4) Create a package in src/main/java named com.promineotech.jeepp. In this package:
 - a) Create a Java class with a main method named JeepSales.
 - b) Add a class-level annotation: @SpringBootApplication and the import statement.
 - c) In the main() method, add a call to SpringApplication.run();. Use JeepSales.class as the first parameter, and the args parameter that was passed into the main() method as the second. The entire class should look like this:

```
package com.promineotech.jeepp;

import org.springframework.boot.SpringApplication;
import org.springframework.boot.autoconfigure.SpringBootApplication;

@SpringBootApplication
public class JeepSales {

    public static void main(String[] args) {
        SpringApplication.run(JeepSales.class, args);
    }
}
```

- 5) Refer to README.docx in the supplied project resources. Copy all files in the Files folder in the resources to your project as described in the README. **Do not copy the files in the Entity or Source folders at this time.**
 - a) Load the files that were added: right-click on the project in Package Explorer and select "Refresh".
 - b) Update the project with the new POM dependencies: right-click on the project in Package Explorer, select "Maven/Update Project". When the "Update Maven Project" panel appears, click "OK".

Web API Design with Spring Boot Week 13 Coding Assignment

- 6) Using the MySQL Workbench or MySQL command line client (CLI), create a database named "jeep".
- 7) Using DBeaver, or the MySQL client of choice, load the supplied .sql files (v1.0__Jeep_Schema.sql, and v1.1__Jeep_Data.sql) into the MySQL database to create the tables and populate them with data. These files are found in the project folder src/test/resources/flyway/migrations.
- 8) Create a new package in src/test/java named com.promineotech.jeep.controller. Create a Spring Boot integration test named FetchJeepTest using the techniques shown in the video.
 - a) Add the @SpringBootTest, @ActiveProfiles, and @Sql annotations as described in the video.
 - b) The class must not be public. It should have package-level access (i.e., not public, private, or protected).
 - c) The video extended FetchJeepTestSupport, but you don't need to do that for the homework. Just put everything in FetchJeepTest. It should look like this:

```
@SpringBootTest(webEnvironment = WebEnvironment.RANDOM_PORT)
@ActiveProfiles("test")
@Sql(scripts = {
    "classpath:flyway/migrations/V1.0__Jeep_Schema.sql",
    "classpath:flyway/migrations/V1.1__Jeep_Data.sql"},
    config = @SqlConfig(encoding = "utf-8"))
class FetchJeepTest {
}
```

- d) Create a test method in FetchJeepTest. The method must have the following method signature:
- e) Inject a TestRestTemplate in the test class. Name the variable restTemplate. Inject the port used in the test using the @LocalServerPort annotation. Name the variable serverPort. The variables and annotations should look like this:

```
@Autowired
private TestRestTemplate restTemplate;
```

Web API Design with Spring Boot Week 13 Coding Assignment

```
@LocalServerPort
```

```
private int serverPort;
```

- 9) Create a new package in `src/main/java` named `com.promineotech.jeep.entity`. In that package, create an enum named `JeepModel`. Add all the jeep models from the `model_id` column in the `models` table in the database. You can use this query in dBeaver: `SELECT DISTINCT model_id FROM models`.
- 10) Create a `Jeep` class in the `com.promineotech.jeep.entity` package. Add the columns from the `models` table into this class as instance variables. Annotate the class with the Lombok annotations `@Data`, `@Builder` (and optionally both `@NoArgsConstructor` and `@AllArgsConstructor`). Note that `modelId` should be of type `JeepModel` and `basePrice` should be of type `BigDecimal`. The class should look like this (remember to add the appropriate import statements):

```
@Data
@Builder
@NoArgsConstructor
@AllArgsConstructor
public class Jeep {
    private Long modelPK;
    private JeepModel modelId;
    private String trimLevel;
    private int numDoors;
    private int wheelSize;
    private BigDecimal basePrice;
}
```

- 11) In the supplied resources, copy all files in the `Entities` folder to the `src/main/java/com/promineotech/jeep/entity` folder. **Do not copy anything from the Source folder at this time.**

Web API Design with Spring Boot Week 13 Coding Assignment

- 12) Back in the test method that you were writing, create local variables for `JeepModel`, `trim`, and `uri`. Set them appropriately like this:

Variable Type	Variable Name	Variable Value
JeepModel	model	JeepModel.WRANGLER
String	trim	"Sport"
String	uri	String.format("http://localhost:%d/jeeps?model=%s&trim=%s", serverPort, model, trim);

- 14)

- a) Send an HTTP request to the REST service that passes a JeepModel and trim level as URI parameters (as shown in the video). Use this method call:

```
ResponseEntity<List<Jeep>> response = restTemplate.exchange(uri,
    HttpMethod.GET, null, new ParameterizedTypeReference<>() {});
```

Make sure to use the import `java.util.List` and `org.springframework.http.HttpMethod`.

- b) Using [AssertJ](#), test that the response that comes back from the server is 200 (success) – or as is shown in the video: `HttpStatus.OK`. The code should look like this:

```
assertThat(response.getStatusCode()).isEqualTo(HttpStatus.OK);
```

Use the import statements:

```
import static org.assertj.core.api.Assertions.assertThat;
```

- c) Produce a screenshot showing the completed test class. 

```

16 import org.springframework.boot.test.web.server.LocalServerPort;
17 import org.springframework.core.ParameterizedTypeReference;
18 import org.springframework.test.context.ActiveProfiles;
19 import org.springframework.test.context.jdbc.Sql;
20 import org.springframework.test.context.jdbc.SqlConfig;
21
22 import com.promineotech.jeeep.entity.Jeeep;
23 import com.promineotech.jeeep.entity.JeeepModel;
24 @SpringBootTest(webEnvironment = WebEnvironment.RANDOM_PORT)
25 @ActiveProfiles("test")
26 @Sql(scripts = {"classpath:flyway/migrations/V0.1__Jeeep_Schema.sql"}, "classpath:flyway/migrations/V0.1__Jeeep_Schema.sql")
27 class FetchJeeepTest {
28     @Autowired
29     private TestRestTemplate restTemplate;
30     @LocalServerPort
31     private int serverPort;
32
33
34     @Test
35     void testThatJeeepsAreReturnedWhenAValidModelAndTrimAreSupplied() {
36         JeeepModel model = JeeepModel.WRANGLER;
37         String trim = "Sport";
38         String uri = String.format("http://localhost:%d/jeeeps?model=%s&trim=%s", serverPort, model, trim);
39         ResponseEntity<List<Jeeep>> response = restTemplate.exchange(uri, HttpMethod.GET, null, new ParameterizedTypeReference<List<Jeeep>>());
40         assertEquals(response.getStatusCode(), HttpStatus.OK);
41         //getRestTemplate().getForEntity(uri, Jeeep.class);
42     }
43     @Test
44     void test() {
45         fail("Not yet implemented");
46     }
47
48 }

```

Web API Design with Spring Boot Week 13 Coding Assignment

d)

15) In `src/main/java`, create a new package `com.promineotech.jeep.controller`. In this package, create an interface named `JeepSalesController`.

a) Add the class-level annotation `@RequestMapping("/jeeps")`.

b) Add the `fetchJeeps` method in a controller interface with the following signature:

```
List<Jeep> fetchJeeps(JeepModel model, String trim);
```

Make sure you use the `List` from `java.util.List`.

c) Add OpenAPI documentation to document the four possible outcomes: 200 (success), 400 (bad input), 404 (not found) and 500 (unplanned error) as shown in the video.

d) Add the parameter annotations in the OpenAPI documentation to describe the `model` and `trim` parameters.

e) Add the `@GetMapping` annotation and the `@ResponseStatus(code = HttpStatus.OK)` annotation as method-level annotations to the `fetchJeeps` method.

f) Add the `@RequestParam` annotations to the parameters as described in the video. The interface should look like this (omitting the OpenAPI annotations):

```
@RequestMapping("/jeeps")

public interface JeepSalesController {

    @GetMapping

    @ResponseStatus(code = HttpStatus.OK)

    List<Jeep> fetchJeeps(@RequestParam JeepModel model,

        @RequestParam String trim);

}
```

```
@OpenAPIDefinition(info = @Info(title="Jeep Sales Service"), servers = {@Server(url = "http://localhost:8080", descr
public interface JeepSalesController {
    @RequestMapping("/jeeps")
    // @formatter:off
    @Operation(
        summary = "Returns a list of Jeeps",
        description = "Returns a list of Jeeps given an optional model and or trim.",
        responses={
            @ApiResponse(
                responseCode = "200",
                description = "A list of Jeeps is returned.",
                content = @Content(
                    mediaType = "application/json",
                    schema = @Schema(implementation = Jeep.class)),
            @ApiResponse(
                responseCode = "400",
                description = "The request parameters are invalid.",
                content = @Content(mediaType = "application/json")),
            @ApiResponse(
                responseCode = "404",
                description = "No Jeeps were found with the input criteria.",
                content = @Content(mediaType = "application/json")),
            @ApiResponse(
                responseCode = "500",
                description = "An unplanned error occurred.",
                content = @Content(mediaType = "application/json"))
        },
        parameters = {
            @Parameter(
```

Web API Design with Spring Boot Week 13 Coding Assignment

g)

```
parameters = {
    @Parameter(
        name = "model",
        allowEmptyValue = false,
        required = false,
        description = "The model name (e.g. 'Wrangler')"
    ),
    @Parameter(
        name = "trim",
        allowEmptyValue = false,
        required = false,
        description = "The trim level (e.g. 'sport')"
    )
}

@GetMapping
@ResponseStatus(code = HttpStatus.OK)
List<Jeep> fetchJeeps(
    @RequestParam(required = false) JeepModel model,
    @RequestParam(required = false) String trim
);
//@formatter:on
}
```

h) Produce a screenshot showing the interface and OpenAPI documentation. 

- 16) Add the controller implementation class named `DefaultJeepSalesController`. Don't forget the `@RestController` annotation.
- 17) Run the application within the IDE and show the resulting OpenAPI (Swagger) documentation produced in the browser. Produce a screenshot of the documentation showing all four possible outcomes.
